

Abstract of the Disclosure

A top portion of the gutter cover section is formed with a pair of longitudinally extending, relatively spaced apart ridges and with a plurality of openings disposed in front of, in between and behind the ridges for draining rainwater into the gutter. A front wall extends downwardly from the top portion and a ledge extends generally horizontally from a lower portion of the front wall. The distance between an upper edge of the front wall and the horizontal ledge is relatively short to improve the versatility and appearance of the cover section. The aluminum alloy from which the cover section is formed is relatively thin, and the openings in the top portion are large enough to facilitate drainage, yet small enough to keep debris from accumulating on the cover section.
